2 Abstract of the Disclosure

3

4 A table saw (10) with a table top (16) over which a saw blade (20) is positioned,
5 whereby the upper region is covered by a guard (26) which is height-adjustable
6 relative to the saw blade (20) in particular, and whereby the saw blade (20) is
7 angularly-displaceable relative to the table top (16), whereby a gap (30) is
8 located between the guard (26) and the table top (16). The table saw is made
9 safer to handle by the fact that the guard (26) includes a protective panel (36)
10 which is movably supported relative to the guard (26) and closes the gap (30) in
11 a manner in particular such that it cannot be penetrated by the operator's fingers.
